4. Application Name

PlateShare

5. Application Description

PlateShare is a web app where users log the meals they cook or eat out, save and share recipes, and follow friends to see what they're making in a social feed. Users can post a dish with a photo, ingredients, steps, and a rating. Other users can like, comment, and save posts to their own recipe collection. Users can also search recipes by multiple filters including ingredients, cuisine, or dietary tag, and view a personal history of everything they've logged.

6. Audience

Our target audience is cooking and food enthusiasts and people new to cooking who are on a budget, short on time, and often stuck making the same few meals. PlateShare helps users discover foods that match the tastes they already enjoy, using ratings and posts from friends and other users. They can search by ingredient, cuisine, or dietary tag and save recipes so they don't get lost in screenshots. The app keeps posting

simple and works on desktop and mobile. It also uses readable fonts, high-contrast colors, and alt text on photos for accessibility.

7. Vision Statement

To enable easy access to global cuisine and cooking. Connect with friends and chefs around the world, share recipes and dishes. Unlike Yelp, or Beli, find recipes and dishes that match your cooking preferences.

8. Version Control

https://github.com/ruma2061/plateshare

9. Development Methodology

We will utilize Agile methodologies to complete our work in short sprints. Our weekly TA meeting will serve as our sprint review, where we show progress and plan the next sprint.

10. Communication Plan

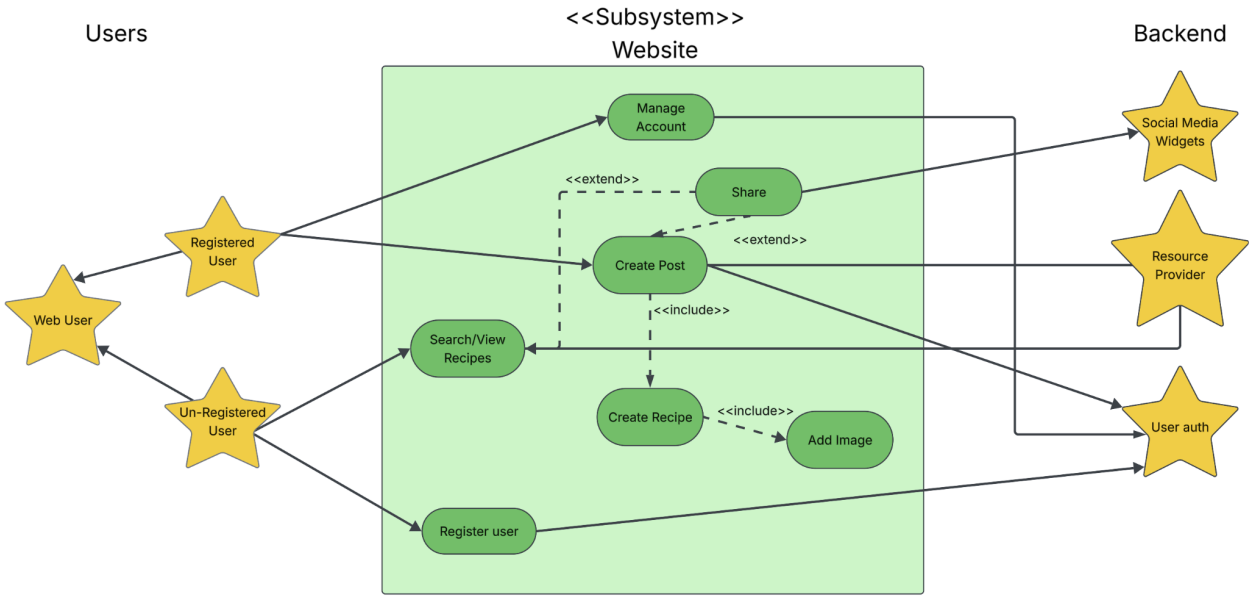

Our team will use Slack for all async communication and coordination. Task-specific discussion will happen in comments on the related GitHub issues to keep conversations organized.

11. Meeting Plan

Team Meeting: Thursdays at 5:00 PM, in person at CSEL.

Weekly TA Meeting: Thursdays at 3:45 PM, in person during lab time in our lab classroom.

Extra Credit

1. Security of user data:
    a. High severity
        i. Hash passwords, use sessions for login, validate all form inputs for correct authentication.
2. Merge conflicts and feature overlap:
    a. Medium severity
        i. Each person will work on their own branch dedicated to different features and require at least one teammate's review before merging. Nobody commits directly to main.
3. Docker/compatibility issues:
    a. Medium severity
        i. Set up the docker-compose file early on, document the setup steps in the ReadMe, and have every member confirm they can run it before feature work starts.
4. Missed tasks:
    a. High severity

        i. Assign every task to a specific person on a Kanban board, check progress at each Thursday meeting, and reassign anything that's stuck early.
5. Feature overload:
    a. High severity
        i. Build an MVP first (login, post meal, feed, friend, save), then add comments and advanced search only once the core features work.
